Tums up!
To strengthen the straight abdominal muscles
Lie on the floor, on your back, with your legs slightly bent and your feet completely flat on the floor. With your arms by your side, lift your head slightly and slide your hands toward your heels. When you feel a tightness in the abdominal muscles, hold the position for approximately 6 seconds, then return to your starting position.

Important:
Keep breathing throughout this exercise.
Repeat the exercise twice. Between each repetition, relax for 30 seconds, taking deep breaths in and out.

The gripper
Use your toes to grip and lift small rounded items (e.g. tissues, a towel, a table tennis ball). Stretch your leg to lift the item to knee height, then lower it to the floor.
Repeat the exercise ten times for each foot.

Sit on the floor and lean back against a wall with your legs straight out in front of you. Flex your toes toward the body and then stretch them away from the body. Do the exercise slowly, and with the greatest range of movement possible (especially when flexing the toes).
Repeat the exercise 15 times for each foot.

Take a look around
To mobilize the cervical spine
Sit up straight, and move your head in slow, controlled movements, all the way through your comfortable range of movement.
1. Tilt your head forward (five times)
2. Turn to the right and left (ten times each side)

Note:
Don't bend your head backwards! The cervical spine does not have a ball and socket joint.

Let’s see the toes
To strengthen and stretch the lower leg muscles
Sit up straight, with the tips of your fingers hooked together at chest height. Pull your elbows outward and maintain the tension for about 5 seconds, then slowly ease off. Repeat the exercise another two times. Afterwards, shake out your arms.

Give yourself a hug!
For stretching the shoulder muscles
Sit up straight on a chair. Tilt your head to one side, pulling the opposite shoulder downward at the same time. You should feel a “tug” in the neck muscles. Hold the stretch for about 20 seconds, then go back to the starting position. Now repeat the exercise on the other side.
Repeat the whole exercise twice.

Get your feet moving
To mobilize the ankles
Sit up straight and lift one foot approximately 10 cm off the floor, angling your leg from the knee rather than the hip. Circle your foot from the ankle 10 times in each direction (clockwise and anticlockwise). Repeat with the other foot. It won’t take long for you to feel the benefits of this exercise.

Sit up straight. Embrace your own shoulders with your arms to feel a stretch between the shoulder blades. Hold this position for about 20 seconds and then return to the starting position. Perform this exercise twice.

Finger hooking
For strengthening the back and shoulder muscles
Sit up straight, with the tips of your fingers hooked together at chest height. Pull your elbows outward and hold the tension for about 5 seconds, then slowly ease off. Repeat the exercise another two times. Afterwards, shake out your arms.

The other point of view
To stretch the lateral neck and back muscles
Finger hooking
For strengthening the back and shoulder muscles
Sit up straight, with the tips of your fingers hooked together at chest height. Pull your elbows outward and hold the tension for about 5 seconds, then slowly ease off. Repeat the exercise another two times. Afterwards, shake out your arms.

The standing wave  
To mobilize the shoulder joints
Stand up straight. Stand up straight with legs slightly apart (about 20cm), and arms stretched straight down. Keeping both arms straight, raise them above your head and then lower them. Perform 10 sets of these controlled arm circles at the full extent of your range of motion.
Repeat this exercise 2 times.

Lifts the shoulders
Stand up straight with feet shoulder width apart and flat on the floor. Breathe in, pulling your shoulders upwards. Breathe out hard and let your shoulders drop.
This exercise should loosen your shoulder muscles. Repeat this exercise 10 times.

Stretching your calves
Stand up straight and step one foot forward by the length of a pace. Your feet should now be parallel and one step offset from each other. Keeping your back foot flat to the floor, bend your front leg slightly, moving your weight over that front foot. Hold for about 20 seconds and then swap legs.
Complete the above exercise twice.

Wall presses
Targeted stretching of the shoulder and chest muscles
Stand alongside a wall, with the arm closest to the wall extended behind you, with the flat of your hand pushing against the wall. To do this correctly, the foot closest to the wall should be stepped forward slightly. You will feel a slight pull in the muscles of your wall-side upper arm and chest. Hold the position for approximately 20 seconds, then move the arm diagonally upwards a little on the wall. Hold for another 20 seconds, then turn around and repeat with the other arm.
Complete the above exercise twice for each side.

Walking
Benefits for the whole body
Take the time for a daily walk. 15 minutes are sufficient! In time, you will be able to walk at greater speed.

Get moving by bike
Cycling improves endurance and prevents joint problems. It also acts as a stress reliever because it stimulates the pituitary gland. The blood flow also increases and helps to reduce fat deposits. Select an easy bike. You can also use the stairs as an athletic activity. Climbing stairs improves endurance and also burns calories.
Start slowly and don’t overdo it. To start with, a little effort gives big benefits.

Stretches at home
Exercise to strengthen the calf muscles
Stand on a soft surface (e.g. on a folded blanket). Now walk on the spot, rolling your weight over the whole of each foot and letting your arms swing loosely at the same time. There’s no limit to how long you do this exercise for! Please don’t overdo it!

The standing wave
To mobilize the shoulder joints
Stand up straight. Stand up straight with legs slightly apart (about 20cm), and arms stretched straight down. Keeping both arms straight, raise them above your head and then lower them. Perform 10 sets of these controlled arm circles at the full extent of your range of motion.
Repeat this exercise 2 times.

Stretch out please!
Stretches for the arm muscles
Raise one arm vertically, and make a reach upwards for a big stretch on that side of your body. Perform 5 reaches in a flowing movement, and then swap arms.
Repeat the whole exercise twice.

Stretching the core muscles
Stand up straight, legs slightly apart, head up. During this exercise, please do not strain the neck or hollow your back. Now raise one arm vertically, and make a reach upwards for a big stretch on that side of your body. Perform 5 reaches in a flowing movement, and then swap arms.
Repeat the whole exercise twice.

Exercise does you good
Fit, with B. Braun Diabetes Care
Lack of exercise and being overweight are critical factors that mean more and more people are developing Type 2 diabetes mellitus. Unfortunately, you can do something about it. The combination of gentle exercise with a diabetes-friendly diet has a positive effect on insulin utilization, blood sugar levels and body weight. With a little dedication and willpower, you can significantly improve your quality of life.
