QUICK GUIDE

Managing

PERISTOMAL SKIN COMPLICATIONS
HOLISTIC ASSESSMENT

- Conduct a full holistic assessment of the patient—including full medical history, diagnosis requiring stoma, mobility status, comorbidities, history of skin problems and any interventions/treatments already undertaken.\(^5\)

- Perform a visual inspection and physical examination of the stoma and peristomal skin—including general appearance, skin integrity, presence and distribution of hair; compare the peristomal skin with adjacent abdominal skin, checking for any changes.\(^6\)

- Assess the patient’s current appliance and any effect this has on the skin. Consider switching to another appliance if necessary, and use appropriate accessories to protect the skin.\(^6\)

- Educate the patient on hygiene, and pouch application and removal. Provide information and support on self-care and ongoing management.\(^6\)

Skincare Tips

- Clean the skin with a pH-balanced product (or in some cases water alone may be used).\(^3\) Do not use emollient or oil-based products, as well as those that may dry the skin. Avoid chemicals that may cause irritation.\(^6\)

- Maintain dry skin in order to reduce the risk of candidiasis. Dry skin is also essential to obtaining a good adhesive seal. After bathing with the pouch on, dry the skin and the pouching system carefully.\(^3\)

- Protect the skin by using nontraumatic adhesives and cleansing the skin carefully. Remove adhesives gently in order to avoid trauma/skin stripping. Consider using a skin sealant to prevent trauma in patients with sensitive skin.\(^3\)
### Examples of common peristomal skin complications

<table>
<thead>
<tr>
<th>Condition</th>
<th>Dermatitis, caused either by a reaction to any component of the appliance (hypersensitivity reaction), or by contact with the stoma effluents (moisture-associated skin damage)⁴,⁵</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symptoms</td>
<td>Redness/rash, swelling, tenderness, heat, effusion, pain/itching⁴,⁵</td>
</tr>
<tr>
<td>Management</td>
<td>Avoid substances that cause allergic reaction,³ and consider using an adhesive remover. Do not use products/chemicals unless there is a specific indication for the individual patient.³ Check the appliance fits correctly and adapt if necessary.³ Consider using a barrier product such as Askina® Barrier Film.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Condition</th>
<th>Pressure damage, caused by tightness or excessive pressure of belt or any appliance that is too tight/rigid⁴,⁵</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symptoms</td>
<td>Erythema that does not resolve within 1-2 minutes of removing a pouching system⁵</td>
</tr>
<tr>
<td>Management</td>
<td>Assess the skin rigorously for pressure/skin damage.³ Discontinue the use of a belt where possible, or loosen when in use.³ If pressure damage occurs, consider management with thin hydrocolloid dressings (e.g. Askina® Biofilm transparent or Askina® ThinSite).³</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Condition</th>
<th>Folliculitis, usually caused by staphylococcal infection or by resulting complications from removing hair from the skin around the stoma⁴,⁵</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symptoms</td>
<td>Lesion originating from the hair follicle, sometimes pustular and with erythema, tends to be superficial⁴,⁵</td>
</tr>
<tr>
<td>Management</td>
<td>Recommend a gentle shaving procedure that is not performed more than once a week.³ Consider antibacterial soap/products.³ Consider using a barrier product (e.g. Askina® Barrier Film and/or Superfiller).³</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Condition</th>
<th>Hypertrophy/papillary changes, which are caused by chronic exposure of the skin to urine⁵</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symptoms</td>
<td>—</td>
</tr>
<tr>
<td>Management</td>
<td>Urine may be acidified by the patient ingesting cranberry juice or vitamin C.³ Consider a barrier product (e.g. Askina® Barrier Film and/or Superfiller).³ Treat with antifungal powder at each pouch change until resolved.³ Educate patient in drying technique and how to avoid a moist environment.³ Consider a skin sealant or protective skin barrier product (e.g. Askina® Barrier Film and/or Superfiller).³</td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Folliculitis</td>
<td>Usually caused by staphylococcal infection or resulting complications from removing hair from the skin around the stoma.</td>
</tr>
<tr>
<td>Hypertrophy/papillary changes</td>
<td>Which are caused by chronic exposure of the skin to urine.</td>
</tr>
<tr>
<td>Yeast infection (candidiasis)</td>
<td>May be caused by leakage, excessive sweating of the skin, antibiotic therapy, or broken skin.</td>
</tr>
</tbody>
</table>

### Symptoms
- Redness/rash, swelling, tenderness, heat, effusion, pain/itching
- Erythema that does not resolve within 1-2 minutes of removing a pouching system
- Lesion originating from the hair follicle, sometimes pustular and with erythema, tends to be superficial

### Management
- Avoid substances that cause allergic reaction, and consider using an adhesive remover.
- Do not use products/chemicals unless there is a specific indication for the individual patient.
- Check the appliance fits correctly and adapt if necessary.
- Consider using a barrier product such as Askina® Barrier Film.
- Assess the skin rigorously for pressure/skin damage.
- Discontinue the use of a belt where possible, or loosen when in use.
- If pressure damage occurs, consider management with thin hydrocolloid dressings (e.g. Askina® Biofilm transparent or Askina® ThinSite).
- Recommend a gentle shaving procedure that is not performed more than once a week.
- Consider antibacterial products.
- Consider using a barrier product (e.g. Askina® Barrier Film and/or Superfiller).
- Urine may be acidified by the patient ingesting cranberry juice or vitamin C.
- Consider a barrier product (e.g. Askina® Barrier Film and/or Superfiller).
- Treat with antifungal powder at each pouch change until resolved.
- Educate patient in drying technique and how to avoid a moist environment.
- Consider a skin sealant or protective skin barrier product (e.g. Askina® Barrier Film and/or Superfiller).
Understanding peristomal skin complications

Unlike wounds, where the ultimate treatment goal is healing, stomas are a breach of the skin that are designed to stay open in order to drain the stoma effluents. Complications to the peristomal skin are common and require specific management.¹

Complications related to the stoma may be surgical or dermatological. Dermatological complications are common, causing a wide range of symptoms and occurring in 45% of patients,¹ and have been shown to have a significant adverse effect on the patient’s quality of life.² Peristomal skin problems account for more than one in three visits to ostomy nurses.²

Therefore the surrounding skin requires scrupulous care to maintain its health and avoid dermatological complications. Healthy skin around the stoma is essential to ensure good adhesion, without which the risk of leaking and further skin damage is increased and creates a vicious circle of skin damage and pouch leakage.³

Preventative action is the most important element of care—the best way to manage peristomal skin conditions is to prevent them in the first place.³ Effect preventative strategies and patient education are vital. Identifying risk factors can help to optimise care. Assessment is crucial—it is important to conduct a targeted visual inspection as well as taking both a holistic and focused patient history.³⁴
PERISTOMAL SKIN ASSESSMENT TOOLS

Several assessment tools for peristomal skin conditions are available. These assessment tools may help facilitate documentation, tracking the patient’s condition and assessing outcomes. Two of these assessment tools are described below.

**SACS Instrument (Studio Alterazioni Cutanee Stomali or Study on Peristomal Skin Lesions)**

Scoring system based on two elements:
- Lesion description: severity and depth of tissue damage (L). The type of lesion is then subcategorised into four types: hyperemic; erosive; ulcerative (with or without nonviable tissue); proliferative.
- Topography: location of the wound around the stoma (T).

**DET score system (Discoloration, Erosion, Tissue overgrowth)**

Instrument for assessment of the extent and severity of peristomal skin change, in terms of:
- **D** - Discoloration
- **E** - Erosion
- **T** - Tissue overgrowth.
